ORGANIC

# ROOTING GEL

SIMPLY  
DIP &  
PLANT

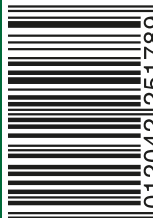

Boosts rooting and  
establishment of cuttings

Vitax Organic Rooting Gel is made with natural plant extracts to help rooting and establish cuttings. It contains no synthetic growth hormones or fungicides. The gel helps the plant retain moisture during the vital early stage after taking the cutting. Suitable for soft, semi-hard or hardwood cuttings.

## HOW TO USE

Take cuttings below a leaf joint using a sharp knife. Remove leaves from the lower half of the cutting. Dip the base of the cutting into the gel. Plant up the cuttings into a suitable moistened, free draining compost.

Place cuttings in a propagation unit or cover with a plastic bag, sealed with an elastic band or similar. Place the cuttings in a light position but protected from direct sunlight. Water as necessary, ensuring the cutting does not dry out.
