

HOW IT WORKS

Maggot damage in apples and pears is mainly caused by caterpillars of the codling moth. Female moths lay eggs in trees. The eggs hatch out into caterpillars which feed ravenously on fruit in early summer. Vitax Apple Maggot Monitoring Trap allows gardeners to assess the infestation problem and apply suitable remedial measures.

WHEN TO USE

Male moths fly and mate on warm nights from mid May to the end of July. Place the trap in the garden mid May.

HOW TO USE

Remove the trap from the packaging and hang the trap at head height on the windward side of the tree or trees. The trap will monitor moths for five average size trees up to 12 metres apart.

Inspect the trap regularly. If more than 12 moths are trapped per week, apply Vitax Plant Guard to wash off any eggs laid and remove debris onto which further egg laying may occur.

Each trap is effective for up to 6-8 weeks. Replace more frequently in dusty conditions.

CONTENTS: 1 trap with hanger

TIPS: Use Vitax Winter Tree Wash in the autumn and winter to help prevent aphid damage the following season. Apply Vitax Tree Grease or Tree Bands to help prevent Winter Moth damage.
