

Epsom Salts

Magnesium is essential for the production of chlorophyll without which plant foliage turns brown and withers. Tomatoes and house plants are particularly susceptible to magnesium deficiency, early symptoms of which are a yellowing between the veins of older leaves.

WHEN TO APPLY

As required during the growing season.

DIRECTIONS FOR USE

As a base dressing (before sowing or planting): Work into the soil at the rate of 70g/m² (2 oz per square yard).

As a liquid feed: Epsom Salts are best applied dissolved in water at the rate of 90g in 4.5 litres (3 oz per gallon). Apply to the leaves with a sprayer or watering can, or add at monthly intervals to normal liquid feeds.

HELPFUL ADVICE

- Read the directions carefully before use.
- Store the fertiliser in a cool dry place away from children, pets and foodstuffs.
- Wash hands after use. Product may irritate cut or broken skin.
- Do not exceed the recommended application rates.
- Avoid fertiliser lodging on leaves and stems.
